Current Situation

Problem

- Hydrogen is a part of the Australian government's pivot towards clean energy.
 - **1** \$540 million pledge for "clean" hydrogen.
 - (i) Global market worth USD155 billion by 2022.
- Can an emissions trading scheme (ETS) be integrated into a blockchain with hydrogen certificates?
 - 1 Or more generally, for any energy certificate?

¹Bruce S, Temminghoff M, Hayward J, Schmidt E, Munnings C, Palfreyman D, Hartley P (2018)

Timeline

Current Situation

Hydrogen Energy

- Hydrogen is a clean fuel that produces only water when consumed.
- Harvested from sources of renewable energy: solar and wind.
- Commonly harvested through natural gas reforming and a technique referred to as *electrolysis*.

Timeline

Current Situation

- Is there a usable blockchain solution that will develop 'trust' in an emissions trading scheme?
- Why? Because customers are wary of centralised authorites with incosistent policy (e.g. Australia).
- How? Using a permissioned blockchain to help develop trust without a centralised authority.

Current Situation

Economics of Emissions Trading

- Fix the supply S of carbon in a market. Ceteris paribus quantity $Q \downarrow$ and the carbon price $P \uparrow$.
- Increasing popularity: big markets are China ETS and EU ETS.
- Market price for carbon permits set through an auction.

The Economist

^{1 &}quot;The World Urgently Needs To Expand Its Use Of Carbon Prices". 2020. The Economist. https://www.economist.com/briefing/2020/05/23/the-world-urgently-needs-to-expand-its-use-of-carbon-prices

Current Situation
Research Timeline

- The use of smart contracts can 'nudge' consumers of hydrogen to use cleaner hydrogen.
 - A 'carbon price' enforced by a player in the system.
- Punishing non-clean sources of energy through smart contracts can accelerate the removal of negative externalities.
 - 1 Rapidly adjust to 'cleaner' equilibria inside a market.
- Economic support: "If economists ruled the world, carbon prices would drive most of the action on climate change" -The Economist.

Hydrogen Certificates

- An approach for formally attesting the level of cleanness in a produced unit of hydrogen.
 - **1** Shared across the supply chain.
 - 2 Can attest to standards related to Hydrogen safety and quality.
- An agent in the blockchain can act as the certification body.
- Producers can use hydrogen certificates in the carbon market to spend carbon tokens.

Current Situation Research Timeline

Token Patterns

- Have a Carbon Coin to represent a permit to emit a certain amount of carbon units (a token).
- Carbon Coin is spent or 'burned' on using a hydrogen certificate.
 - A hydrogen certificate has a level of associated carbon.
- An authority handles the issuance of tokens to producers of carbon.
- Tokens are able to be purchased in auctions run by an authority (e.g. EU ETS).

Summary

Overview Overview

Architecture Methodology

Timeline

Current Situation

Token Derivatives

- To replicate a real emissions trading scheme like EU ETS, individuals can buy and sell derivatives of carbon tokens outside of a centralised authority.
- Financial derivatives are mappable to real tokens allowing producers to emit carbon.
- Optional trading of carbon tokens based on a 'carbon reputation' of a buyer/seller.

Methodology Extensible Contra

Current Situation

Summary

- The government can use the blockchain to deliver trust and growth in emissions trading.
- Smart contracts can be applied for the buying/recording of emissions in a carbon market for producers.
- Previous blockchain energy solutions rely on centralised parties or use the blockchain to act as an 'auction house'.
- Prior attempts disrespect user freedom by assigning a reputation to actors in a carbon market.
- Blockchain has seen recent leaps with high throughput transactions making the technology for a blockchain carbon market feasible.
